

Operational Governance Standard

Document ID: DOC-006

Document Type: Governance Standard

Version: 1.0

Effective Date: 2026-01-01

Status: Active

Purpose

This standard defines governance expectations for operational decision-making and escalation.

Operational decisions should use current approved information, have a clear accountable owner and maintain appropriate auditability.

Teams should distinguish approved guidance from draft, archived or superseded material.

Decisions should be proportionate to the operational risk, documented where required and reviewed when circumstances change.

Automated or AI-supported systems may assist operational teams but should not remove human accountability.

Evidence used to support operational decisions should be traceable to an identifiable source and lifecycle status.

Human oversight remains required for significant operational decisions.
