Severe Weather Readiness

Severe weather may affect patient demand, workforce availability, transport, supply chains and access to community services.

Operational teams should monitor weather warnings, forecast conditions and known organisational vulnerabilities.

Readiness activity should begin before expected disruption where credible weather information indicates increased operational risk.

Operational Response

During severe weather, operational leadership should review staffing resilience, transport disruption, critical supplies, patient flow and business continuity arrangements.

Escalation decisions should reflect the combined impact of weather conditions and existing organisational pressure.

The Severe Weather Operational Plan should complement, rather than replace, wider winter-pressure and business continuity arrangements.
