Whole-Site Patient Flow

Effective site flow requires coordination across emergency care, inpatient services, bed management, discharge services and operational leadership.

Flow pressure should be assessed using multiple indicators, including bed occupancy, emergency demand, delayed discharge, ambulance handover and available workforce.

No single operational metric should be interpreted in isolation.

Site Coordination Actions

During periods of significant pressure, the site coordination function should identify major operational bottlenecks, assign actions, record ownership and review progress.

Actions may involve bed capacity, discharge coordination, workforce escalation, emergency-flow measures and cross-service support.

The purpose is to coordinate operational response rather than replace individual service procedures.
